Model Comparison: residuals - Concentration

Name Thermally treated soil NL

Legend

Total Average Deviation Square root of the sum of the squared values of residuals divided by the number of values, over the entire X range.
User Average Deviation Square root of the sum of the squared values of residuals divided by the number of values, over the user defined X range.
Fractional Average Deviation Square root of the sum of the squared values of residuals divided by the number of values, over the fraction.
 Note that the Total and User Average Deviation columns are averages as well.

Yellow = own pH All residuals within + 1 or - 1 are considered to represent a good fit.

- As Measurements at MDL
- K Both Na and K show similar pH dependence, which may be linked to dissolution of silica phases. Otherwise no indication what is causing this behaviour
- Li Strong pH dependent behaviour. As yet no phases identified that can explain the behaviour over the wide pH range where solubility control is active. Possibly linked to Si phases?
- Mg Further look into carbonate phases
- Na Both Na and K show similar pH dependence, which may be linked to dissolution of silica phases. Otherwise no indication what is causing this behaviour
- Pb Measurements at MDL
- Se Difficult element to capture due to lacking thermodynamic data. Experimental minerals may need to be adjusted.
- V Reasonable description. Info lacking at pH > 9
- Zn Good description. Measurements at own pH at MDL
